L7 ANSWER 2 OF 19 USPATFULL on STN

TI Emission ratiometric indicators of phosphorylation  
AB A chimeric phosphorylation indicator is provided. A chimeric  
phosphorylation indicator can contain a donor molecule, a  
phosphorylatable domain, a phosphoaminoacid binding domain (PAABD), and  
an acceptor molecule. A chimeric phosphorylation indicator also can  
contain a phosphorylatable polypeptide and a fluorescent protein,  
wherein the phosphorylatable polypeptide is contained within the  
sequence of the fluorescent protein, or wherein the fluorescent protein  
is contained within the sequence of the phosphorylatable polypeptide.  
Also provided are polynucleotides encoding such chimeric phosphorylation  
indicators, as well as kits containing the indicators or the  
polynucleotides. In addition, a method of using the chimeric  
phosphorylation indicators to detect a kinase or phosphatase in a sample  
is provided.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L7 ANSWER 3 OF 19 USPATFULL on STN

TI Non-oligomerizing fluorescent proteins  
AB A non-oligomerizing fluorescent protein, which is derived from a

fluorescent protein having at least one **mutation** that reduces or eliminates the ability of the fluorescent protein to oligomerize, is provided. The non-oligomerizing fluorescent protein can be derived from a naturally occurring green fluorescent protein, a red fluorescent protein, or other fluorescent protein, or a fluorescent protein related thereto. Also provided is a fusion protein, which includes a non-oligomerizing fluorescent protein linked to at least one polypeptide of interest. In addition, a polynucleotide encoding a non-oligomerizing fluorescent protein is provided, as is a recombinant nucleic acid molecule, which includes polynucleotide encoding a non-oligomerizing fluorescent protein operatively linked to at least a second polynucleotide. Vectors and host cells containing such polynucleotides also are provided, as are kits containing one or more non-oligomerizing fluorescent proteins or encoding polynucleotides or constructs derived therefrom. Further provided are methods of making and using the proteins and polynucleotides.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L7 ANSWER 4 OF 19 USPATFULL on STN

TI Optical probes and assays

AB This invention provides an optical probe useful as an optical probe or sensor of post translational type modifications, such as phosphorylation. The invention comprises a polypeptide moiety, which contains a recognition motif for a post translational type activity and a protease site, which is coupled to a probe moiety. Modification of the polypeptide, by the post translational type activity, results in a modulation of the rate at which a protease cleaves the polypeptide which is sensed by a measurable change in at least one optical property of the optical probe upon cleavage. The present invention also includes a recombinant nucleic acid molecule that encodes an optical probe and a vector and host cell or library of cells that include the recombinant nucleic acid molecule. The optical probe can be used in methods to determine whether a sample, including a cell or a sample from an organism, contains a post-translational type modification activity. Such methods can also be used to determine whether a test chemical modulates the activity of a modifying activity, and thus can be used to identify therapeutic compositions. The identification of such therapeutic compositions can be automated using a system that includes an optical probe.

L7 ANSWER 5 OF 19 USPATFULL on STN  
TI Monomeric and dimeric fluorescent protein variants and methods for making same  
AB The present invention relates generally to variant fluorescent proteins, and more specifically to monomeric and dimeric forms of Anthozoan fluorescent proteins. In one aspect, the present invention provides variants of fluorescent proteins, where the variants have a reduced propensity to tetramerize, and form dimeric or monomeric structures. The invention also relates to methods of making and using such fluorescent protein monomers and dimers.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

TI Fluorescent protein sensors for detection of analytes  
AB Fluorescent indicators including a binding protein moiety, a donor  
fluorescent protein moiety, and an acceptor fluorescent protein moiety  
are described. The binding protein moiety has an analyte-binding region  
which binds an analyte and causes the indicator to change conformation  
upon exposure to the analyte. The **donor moiety** and  
the acceptor moiety change position relative to each other when the  
analyte binds to the analyte-binding region. The **donor**  
**moiety** and the acceptor moiety exhibit fluorescence resonance  
energy transfer when the **donor moiety** is excited and  
the distance between the **donor moiety** and the  
acceptor moiety is small. The indicators can be used to measure analyte  
concentrations in samples, such as calcium ion concentrations in cells.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L7 ANSWER 14 OF 19 USPATFULL on STN  
TI Fluorescent protein sensors for detection of analytes  
AB Fluorescent indicators including a binding protein moiety, a donor fluorescent protein moiety, and an acceptor fluorescent protein moiety are described. The binding protein moiety has an analyte-binding region which binds an analyte and causes the indicator to change conformation upon exposure to the analyte. The **donor moiety** and the acceptor moiety change position relative to each other when the analyte binds to the analyte-binding region. The **donor moiety** and the acceptor moiety exhibit fluorescence resonance energy transfer when the **donor moiety** is excited and

the distance between the donor moiety and the acceptor moiety is small. The indicators can be used to measure analyte concentrations in samples, such as calcium ion concentrations in cells.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L7 ANSWER 16 OF 19 USPATFULL on STN  
TI Long wavelength engineered fluorescent proteins

AB This invention provides functional engineered fluorescent proteins with varied fluorescence characteristics that can be easily distinguished from currently existing green and blue fluorescent proteins. In one aspect, the invention provides nucleic acids, expression vectors and recombinant host cells comprising nucleotide sequences encoding functional engineered fluorescent proteins comprising aromatic substitutions at position 66 and a folding **mutation**. In one embodiment the invention provides for fluorescent proteins containing an aromatic substitution at Thr 203.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L7 ANSWER 17 OF 19 USPTFULL on STN

TI Long wavelength engineered fluorescent proteins  
AB This invention provides functional engineered fluorescent proteins with varied fluorescence characteristics that can be easily distinguished from currently existing green and blue fluorescent proteins. In one embodiment the invention provides for the three dimensional structure and atomic coordinates of an Aequorea green fluorescent protein and methods for their use. In one embodiment, this invention provides a computational method of modeling the three dimensional structure of any other fluorescent protein based on the three dimensional structure of an Aequorea green fluorescent protein.

L7 ANSWER 19 OF 19 USPATFULL on STN

TI Tandem fluorescent protein constructs

AB This invention provides tandem fluorescent protein construct including a donor fluorescent protein moiety, an acceptor fluorescent protein moiety and a linker moiety that couples the donor and acceptor moieties. The donor and acceptor moieties exhibit fluorescence resonance energy

transfer which is eliminated upon cleavage. The constructs are useful in enzymatic assays.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
